# WORKING OF THE PROJECT

- ❖ First the user inputs 6 random numbers from RAM[0] to RAM[5].

0	7
1	3
2	54
3	6
4	1
5	58

- ❖ Two variables l and i are created at the starting of the program and the values are initialized to 0 and 30 respectively. l is used for iterating from 0 to 5 whereas i is used for iterating from 30

16	0
17	30

- ❖ Any odd number when performed logical AND with 1 will produce an output of 1 and any even number when performed logical AND with 1 will produce an output of 0.

- ❖ Now the emulator takes up values from RAM[0] to RAM[5] and if a value is found out to be odd, it is stored from RAM[30] onwards.

30	7
31	3
32	1

- ❖ Now when the emulator reaches the 6<sup>th</sup> register it will jump to the sorting instructions. i value is changed to 30

16	6
17	30

- ❖ The emulator considers values inside RAM[i] and RAM[i+1]. If RAM[i] is greater than RAM[i+1] the value gets swapped. Upon reaching 0, the emulator checks if the values are sorted, if not it will repeat the sort cycle.

Output after 1<sup>st</sup> cycle

30	3
31	1
32	7

Output after completion

30	1
31	3
32	7

- ❖ If all the values are sorted it will jump to ending infinite loop where the variables l and i are set to 0

16	0
17	0

## INSIGHTS LEARNED DURING IMPLENTATION

- ❖ The assembly language does not have operators like division, modulo etc , but it is achievable through logical operations like AND NOT etc.
- ❖ Usage of labels while coding in assembly language is a good practise as it helps in the flexibility of the code as well as helps to understand the code.
- ❖ It is a very good practise to write pseudo code before writing the asm file as it helps to reduce the chance of getting errors by a large margin.
- ❖ Identifying logical errors in machine language is a hard and is an almost impossible task. So it is always a good practise to test the code manually by hand before running the code on the emulator.
- ❖ Another advantage that we learned from assembly language is that since it directly works with the hardware we can store specific inputs in the registers according to our choice
- ❖ It also gives us a good picture of how the computer performs the complex tasks such as sorting etc using the ALU
